

StabilAir

The Vertical Air Cell Cushion with slowed airflow for stability

Star StabilAir – Slowed Airflow

The StabilAir cushion is a single chamber vertical air cell cushion with foam baffles for added stability, making the StabilAir the perfect first air cushion.

Slowed Airflow Enhancing Stability

Each StabilAir cushion has two sizes of foam cylinders which are higher on the outside, while those under the buttocks, coccyx and legs are lower. The foam cylinders in the air cells function as baffles, slowing the movement of air and enhancing stability. The air pocket above the foam similarly enables effective pressure redistribution, just like all Star Cushions.

Star StabilAir cushion comes complete with a fitted cover, hand inflator pump, user manual and repair kit.

Precision Manufacturing

The Star range is manufactured in Sweden with cutting-edge robot production to ensure precision and consistency.

Features and Benefits

Vertical Air Cell

Interconnected vertical air cell cushions have a long history of being used for pressure redistribution due to high envelopment and immersive properties, and reduced surface tension.

Adjustability

The air level can be adjusted and reset again and again to achieve to optimal amount of immersion for the individual.

Pressure Redistribution

StabilAir's interconnected air cells ensure excellent pressure redistribution properties, continually readjusted to the user's shape as they move in their seat.

Foam Baffles

Each cell has a built-in soft foam cylinder, which acts as a baffle, slowing air movement throughout the cushion to increase stability. In addition, the foam cylinders are higher on the side to maximise stability.

Setting up StabilAir

The air level of the Star cushions can be set easily following the user manual and animated video.
